If we stand a chance of achieving the SDGs by 2030, we need to radically rethink the way we approach data challenges, especially among low- and middle-income countries. Local and sub-national data can have a transformative impact on sustainable development, humanitarian crises and climate change, yet harnessing and scaling local data can be a challenge. This one-day event hosted by PARIS21, the Swiss Federal Statistical Office’s Project Rosling and the Canton of Basel will bring NGOs, international organisations and countries together to explore the promise and pitfalls of local and sub-national data in developing country context.

Registration opens January 2023
