MEASURING DISTANCE TO THE SDG TARGETS

An assessment of where OECD countries stand

June 2017
EXECUTIVE SUMMARY

1. The 2030 Agenda for Sustainable Development, adopted by world leaders at the United Nations on 25 September 2015, sets out an ambitious plan of action for people, planet and prosperity, with the overarching objective of leaving no one behind. At its core are 17 Sustainable Development Goals (SDGs) comprising 169 targets.

2. This Study of the distances from the SDGs of selected OECD countries is designed to help governments as they consider developing national action plans, as well as to contribute to SDG mainstreaming across different OECD Directorates. It leverages the wealth of statistical data collected by OECD members and harmonised through OECD tools and processes. This booklet updates the Pilot Study, published by OECD in July 2016, by offering a wider set of indicators and more complete coverage of the Agenda 2030 targets, as well as a refined methodology for assessing distance to those targets.

3. This Study uses the latest information on various indicators available in OECD databases to establish countries’ distances from individual targets, and presents results for a number of countries. These starting positions are measured in terms of the distance to be travelled by 2030. This requires setting end-values for the targets to be achieved by 2030. The Study uses a flexible approach to target setting, with appropriate consideration being given to values specified either in the 2030 Agenda or in other international commitments, but also using the current range of OECD performance as a rating scale where no such benchmarks have been enunciated.

4. Taking as a reference the global indicator set endorsed by the UN Statistical Commission at its 47th session, OECD indicators have been selected based on criteria of relevance, ability to differentiate countries’ performance, availability and statistical quality. Applying these criteria, this document identifies 131 indicators covering 98 targets spanning all 17 Goals. It is, however, clear that many SDG targets cannot be currently measured adequately through data routinely collected by the OECD, and that significant statistical work is needed to fill some of these gaps. The OECD is well positioned to advance this agenda, given its expertise in developing policy indicators and in assessing interconnectedness and policy coherence.

5. In order to help interested countries explore the trans-boundary effects or contributions of their policies and development patterns, this Study also proposes an initial assessment of countries’ ‘global contributions’ (e.g. aid flows to less developed countries or consumption-based carbon dioxide emissions) to meeting some of the targets in the 2030 Agenda.

6. While the assessment of starting positions has been undertaken at target level, the results can also be considered by Goal as well as through a global contribution lens. On average, OECD countries are currently closest to reaching targets related to water, climate, biodiversity, cities, poverty and oceans. They have the greatest distance to travel in relation to gender equality, education, the economy and jobs, and institutions. Indicators can also be aggregated by the ‘5 Ps’ in the 2030 Agenda: People, Planet, Prosperity, Peace and Partnership. Based on this breakdown, OECD average scores are best on Planet, and Partnership, to a lesser extent on Prosperity, with People and Peace lagging behind.
It is nonetheless important to underscore that this assessment is based only on what can be measured today. The selected indicators enable only 57% of all the SDG targets to be evaluated, and coverage is unequal across goals and the 5Ps. For example, while health and education have at least one indicator per target, oceans are covered in a very limited way. Similarly, while over 80% of the targets in the People category are covered by at least one indicator, this is true for fewer than 40% of the targets in the Planet category. Given the limitations of current data, assessments of relative performance across the goals and 5Ps should be regarded as preliminary, and may change as more indicators become available in the future.

The variation in countries’ distance to travel across both goals and targets, as well as the variation in data coverage, suggest that national priorities for implementing the SDG agenda should be set at target level, rather than at the goal or 5P level.

Finally, this Study shows that, to implement the 2030 Agenda, countries may need to develop additional indicators and evidence to identify and track progress on policies that drive outcomes at the country level and that have significant trans-boundary impacts.

1. Introduction

10. On 25 September 2015, world leaders meeting in New York adopted United Nations Resolution 70/1, “Transforming our World: the 2030 Agenda for Sustainable Development”. The Agenda is “a plan of action for people, planet and prosperity”, and “also seeks to strengthen universal peace in larger freedom”.

11. The core of the Agenda is a set of 17 Sustainable Development Goals comprising 169 targets that draw on a large number of previous international agreements, especially concerning development, the environment and human rights (Figure 1). The Goals are presented as “integrated and indivisible, global in nature and universally applicable”. The Agenda presents them as addressing the 5Ps: People (broadly corresponding to Goals 1-5), Planet (6, 12, 13, 14 and 15), Prosperity (7-11), Peace (16) and Partnership (17).

12. Still, this does not mean that every target applies to every country. Rather: “Targets are defined as aspirational and global, with each Government setting its own national targets guided by the global level of ambition but taking into account national circumstances. Each Government will also decide how these aspirational and global targets should be incorporated into national planning processes, policies and strategies.”

Figure 1. The 17 Sustainable Development Goals

13. Once countries have decided their national targets, and how they will be integrated into national processes, they will need to decide on how to implement policy strategies to achieve those goals, and how to track progress in their implementation plans. The 2030 Agenda “encourage[s] member states to conduct regular and inclusive reviews of progress at the national and sub-national levels”, but leaves the modalities of this national review process to their discretion. The Agenda provides much detail, however, concerning SDG follow-up and review at global level. This will include an annual report by the UN Secretary-General, and a four-yearly review by a High Level

Political Forum, both of which will be supported by a set of global indicators. There will also be reviews at regional and thematic levels.  

---

**Box 2. The OECD Action Plan on SDGs**

The OECD Action Plan on SDGs [C/MIN(2016)6] aims to:

- **Apply an SDG lens to the OECD’s strategies and policy tools**: OECD Committees are encouraged to identify opportunities to contribute to SDG implementation in their programmes of work. Mainstreaming the SDGs may also involve revisiting thematic strategies (e.g. on innovation, skills, or green growth).

- **Leverage OECD data to track progress in the implementation of the SDGs**: The OECD will, *inter alia*, provide data for the UN-led Global Indicator Framework for the SDGs; help developing countries address data gaps (in collaboration with PARIS21); broaden its Programme for International Student Assessment (PISA) for developing countries; modernise its development finance statistics; develop and expand its Revenue Statistics; and measure policy and institutional coherence for migration and development.

- **Upgrade OECD support for integrated planning and policy-making at country level, and provide a space for governments to share their experiences on governing for the SDGs**: The OECD will leverage the expertise gained through Multidimensional Country Reviews, Policy Coherence for Development work and other tools to help its members address multidimensional issues and connect policies across the board.

- **Reflect on the implications of the SDGs for OECD external relations**: This will include engaging with UN entities, fora and processes on the 2030 Agenda to maximize synergies.

---

14. OECD expertise that can be mobilised in support of the 2030 Agenda is described in the OECD Action Plan on SDGs (Box 1) and includes:

- Assessing economic, social and environmental progress through measures going beyond GDP (e.g. the work on multidimensional well-being, Box 2), and facilitating comparison across and within countries.

- Generating solid evidence and recommendations on global public goods and “bads”, including, for example, analysis of climate policies, development finance, foreign bribery, human trafficking, responsible business conduct and fiscal transparency.

- Measuring and improving development finance by helping governments mobilise the broad suite of financial resources (taxes, foreign and domestic investments, remittances, aid and philanthropy) that will be necessary to achieve the SDGs in many countries.

- Enhancing policy and institutional coherence by identifying policy interactions, trade-offs and synergies across economic, social and environmental areas; and considering trans-boundary and intergenerational effects.

- Dismantling intellectual and policy silos, facilitating the exchange of knowledge across countries, and supporting sector-specific initiatives and partnerships.

Box 2. The OECD well-being framework and the 2030 Agenda

The OECD has long recognised the multidimensionality of people’s lives and of the resources sustaining people’s well-being over time. In its 2011 How’s Life? report, it launched the Better Life Initiative which featured a scoreboard of headline indicators to monitor progress across 11 dimensions of current well-being in OECD countries. These dimensions drew on the framework put forward by the report of the Commission on the Measurement of Economic Performance and Social Progress (Stiglitz et al., 2009), and were assessed as relevant to societies across the world, irrespective of their level of socio-economic and human development (Boarini et al., 2014).

The OECD well-being framework focuses on people rather than the economic system; it includes both objective aspects observable by third parties and subjective states known only to individuals, and it concentrates on outcomes (e.g. health status) rather than inputs (e.g. health-care spending) or outputs (e.g. the quality and quantity of surgery). The framework also takes account of inequalities within each dimension, reflecting the idea that community and societal welfare reflects both average outcomes and how they are distributed across people with different characteristics. Finally, the framework recognizes the importance for well-being outcomes to be sustainable over time. This requires preserving different types of capital whose benefits will accrue over time but that are affected by decisions taken today. The focus on these resources is in line with the recommendations of Stiglitz et al. (2009) and other measurement initiatives that distinguish between well-being “here and now” and the stocks of resources that affect the well-being of generations coming “later” (UN, 2014).

How do these elements align with the key features of the 2030 Agenda? There are both similarities and differences, and the two approaches are complementary even though they differ in nature. The OECD well-being framework is an analytic and diagnostic tool to assess the conditions of a community, whereas the 2030 Agenda is a list of policy commitments agreed by world leaders. The two therefore differ as the results of a full medical check-up would differ from the list of treatments a doctor might then prescribe. Yet, just as we would expect the treatments to address the problems identified, in practice the policy commitments in the 2030 Agenda touch on practically all of the dimensions considered in the OECD well-being framework. As shown by Table 1 below:

- 8 of the 17 SDGs map to 9 of the 11 dimensions of the OECD framework for current well-being. In most cases, the mapping is one-to-one – e.g. SDG 3 on health maps to the OECD dimensions of “health status”. Sometimes, however, more than one SDG is relevant for a single OECD well-being dimension – e.g. various aspects of SDGs 1 and 2, on poverty and food respectively, map to the OECD dimension of “income and wealth”. In other cases a single SDG maps to several OECD dimensions – e.g. the decent work aspects of SDG 8 map to two OECD dimensions, “jobs and earnings” and “work-life balance”. Only two OECD dimensions do not map to any SDGs: “social connections” and “subjective well-being” (although “promoting well-being for all” is part of SDG 3 on health).

- 3 of the 17 SDGs relate strongly to the cross-cutting “inequality” aspect of the OECD well-being framework. The relation is direct in the case of SDG 10 on reducing inequalities. However, SDG 1 on poverty also addresses inequality, especially through its target to raise the income of the bottom 40%; and SDG 5 on gender equality concerns the inequalities experienced by a specific population group. More generally, the SDGs’ emphasis on “leaving no one behind” underscores the importance of looking at outcomes across a range of population characteristics, such as age, gender, disability and socio-economic status.

The four types of “capital” that sustain future well-being in the OECD framework are clearly reflected in 11 of the 17 SDGs. Natural capital is dealt with in SDGs 12 on sustainable production, 13 on climate, 14 on oceans, and 15 on biodiversity. Economic capital is recognized in SDGs 7 on energy, 8 on decent work and the economy, and 9 on infrastructure. Human capital is the focus of SDGs 3 on health and 4 on education, while social capital is addressed by SDG 16 on institutions. In some cases, the same SDG may be relevant for both current well-being and sustainability: for example SDG 3 on health aims at lowering mortality and morbidity now, while supporting vaccine development for the future.

Conversely, two aspects of the 2030 Agenda do not feature in the OECD well-being framework. The first is SDG 17 (means of implementation); this reflects the choice in How’s Life? to focus on universally-valued outcomes, rather than the country-specific policies needed to attain them. The second is the 2030 Agenda’s focus on the “shared responsibility” of all countries in delivering global public goods and avoiding negative global impacts. This element does not feature in the OECD framework because of its focus on the conditions prevailing in each community, rather than on drivers (some of them external) shaping both current well-being and its sustainability. The focus on global public goods in 2030 Agenda and on domestic policies and consumption patterns that can affect them is a genuine innovation, giving expression to the “elsewhere” dimension stressed in the Conference of European Statisticians recommendations on measuring sustainable development (UN, 2014).

15. The analytical framework of the present Study takes as its point of departure the 17 goals and 169 targets of the 2030 Agenda. The indicators included in the Study are also closely aligned with the 230 indicators of the UN global indicator framework developed by the UN Inter-Agency Expert Group on SDG indicators (IAEG) and recently endorsed by the UN Statistical Commission.

16. The Study is not intended to support or supplant UN reporting. Its main objective is rather to provide an innovative analytical tool that may help OECD member and possibly other countries to plan SDG implementation, identify policy priorities, and develop their own reporting tools. Separately, the OECD is also significantly contributing to UN Statistics Division efforts.4

17. This report is organised as follows. Section 2 discusses the nature and purpose of the Study. Section 3 deals with the Study’s methodology, selection of indicators and how these indicators measure countries’ “distance to travel” to meet the ambitions set for 2030. Section 4 summarises the Study’s findings. Section 5 indicates some of the uses countries have made of the Study, and Section

---

4. The OECD is supporting the UN reporting process first through its active participation in the work of the UN Inter-Agency Expert Group on SDG Indicators. It is responsible for providing a number of indicators for the UN Global monitoring framework either directly (e.g. ODA data) or in collaboration with other international organisations (e.g. education-related indicators with UNESCO). The OECD is also helping to fill indicator gaps, leading or providing assistance in conceptual and developmental work in key areas (e.g. Total Official Support for Sustainable Development – TOSSD, governance statistics). Finally, it will assist SDG reporting in developing countries by building capacity through joint work with PARIS21.
6 concludes. Annex I reviews the metadata used in the Study, and Annex II presents the country profiles with Study results for participating countries.

2. Nature and purpose of the Study

18. The Study aims to support the ongoing OECD reflection on how to apply an SDG lens to its work and processes. It is based on a set of indicators that can be used to assess where countries currently stand in relation to the goals and targets of the 2030 Agenda.

19. The Study also aims to help countries working to define national action plans by:

- Identifying available comparative indicators that Members could use to set strategic priorities within the SDG agenda and to track progress towards them.
- Offering an approach to assessing the international contribution, or potential global impact of policies.
- Highlighting SDG areas where statistical development will be particularly important, either to track progress or to advance understanding of the policy drivers of SDG outcomes.

20. In order to fulfil these aims, this Study has been kept as simple as possible. For a start, it has been limited to Member countries’ distances to travel to reach the SDG targets; no attempt has been made to assess past or likely future rates of progress. A second important simplification is that all OECD countries have been treated equally on all indicators. This may seem uncontroversial but is, in some ways, unfair. For example, some OECD members have not subscribed to United Nations development aid targets, which were designed to apply to economically advanced countries; yet where data are available, these members have been assessed on the same scale as others. This would need further consideration before a full-fledged assessment could be produced.

21. Some other, mostly technical, simplifications are explained later in the course of presenting the analysis. These have not been introduced lightly, but have been designed to keep this Study focused on its key objectives of helping and informing interested member countries about their distance from the target level to be achieved by 2030. However, the need for simplifications reinforces the point made earlier that the results of this Study should not be taken as a definitive assessment, but rather as a means of advancing thought and action on how members could identify the SDGs areas where more urgent attention is needed at both national and global levels.

3. Study methodology

i) A brief history

22. A pilot of the OECD Study was first presented to OECD Ambassadors in July 2016, as an example of a possible deliverable for the OECD Action Plan on SDGs. Participation in the pilot was voluntary, and included Denmark, Finland, Netherlands, Norway, Slovenia and Sweden. Belgium, the Czech Republic, Italy, Korea, Luxembourg, Latvia and Slovakia subsequently decided to join the Study. The Action Plan was discussed at the 2016 Ministerial Council Meeting and approved in December 2016 [C(2016)166/REV2].

23. Between September 2016 and January 2017, national seminars were organised in several countries participating in the Study, and a second seminar for OECD Ambassadors took place in

---

5 For the complete metadata, see www.oecd.org/std/OECD-Measuring-Distance-to-SDGs-Targets-Metada.pdf
December 2016, followed by a technical workshop with national officials working on SDG implementation. Feedback from these events, and directly from countries, has led to refinements in the Study methodology, relative to the pilot. The indicator set has been considerably extended, and the normalisation method for comparing distance to targets has been adjusted. These refinements are detailed in the two following sections.

ii) From targets to indicators

24. The United Nations Statistical Commission, meeting in March 2016, adopted a “global indicator framework” comprising 230 indicators, a few of them used against more than one target. However, in a separate document the UNSC acknowledged “obvious theoretical and methodological constraints”, which meant that “refinements and improvements to several indicators will be needed over the years” and that the proposed indicators were “intended for global reviews and... not necessarily applicable to all national contexts and country reviews”.

25. In fact, many of the indicators on the global list do not yet exist, and some still need to be fully defined. A number of countries have examined the list and found that they could only report on about 25% of them. At the same time, various indicator lists have been put forward by other institutions. In several cases, however, the indicators included in these lists refer only to the Goals and bear limited relevance to some of the specific targets in the 2030 Agenda.

26. This assessment builds on the UN global indicator framework and relies on a dataset that measures OECD countries’ relative distances from those targets where sufficiently good and comparable information could be found. The selected indicators have:

- **Face validity**, i.e. they are related to the main thrust and intention of the relevant target;

- **Discriminatory power**, i.e. they show a range of performance among OECD countries while speaking to the country’s reality;

- **Broad availability**, covering at least 20 OECD countries for a relatively recent year;

- **High statistical quality**, i.e. they are computed according to internationally accepted standards, guidelines or good practices;

27. Against this background, and bearing in mind countries’ requests that indicators be closely aligned with the IAEG Global List, the following indicator selection rules were followed:

- First, the Study includes 65 OECD indicators directly comparable with those in the UN Global Indicators Database. Using OECD indicators ensures that data have been standardised to facilitate country comparison within the OECD. An example is productivity growth (growth of GDP per hour worked), for which OECD data is of high quality and meets demanding international statistical standards.

- Second, where data did not yet exist in the UN Global Indicator Database, the Study has used a total of 14 proxies from OECD sources. As an example, the share of students above a minimum proficiency level in environmental science, sourced from the OECD PISA Study.

---

6 The UN Sustainable Development Solutions Network originally proposed 100 global monitoring indicators but emphasised that producing them on a recurrent basis would require a “data revolution” (page 3 of the linked document). More recently, UNSDSN has focused on actual data availability; in three recent publications (the first one with the Bertelsmann Stiftung) it proposed four different SDG indicator sets, each comprising between 34 and 39 indicators. Both exercises rely heavily on OECD datasets.
was used as a proxy of the IAEG indicator “extent to which education for sustainable development is mainstreamed at all levels”.

- Third, where no OECD sources exist, the Study has used 37 indicators for which data are available on the UN Global Indicators Database. One example is the prevalence of moderate or severe food insecurity in the adult population.

- Fourth, the Study has used 15 OECD indicators that are not on the IEAG Global List, but which are nonetheless relevant to capture the challenges that SDG targets raise. As an example, an OECD indicator of social assistance adequacy was used to complement the measure of social assistance coverage. In these cases indicators were only selected if they (i) reflected the main drive and intention of the relevant target; (ii) were available for at least 20 OECD countries for a recent year; and (iii) were measured and compiled according to international standards, guidelines or good practices.

28. As a result of these rules, suitable indicators were identified for 98 out of 169 targets, as compared with 73 in the pilot version. For a few targets – those that are multifaceted, phrased in general terms, or open to different statistical interpretations – more than one indicator was identified. Overall, 131 indicators (128 unique indicators, since two indicators are used to assess more than one target) were included in the dataset of the Study, up from 86 in the pilot version.

29. Even so, the selected indicators still only enable 57% of all the SDG targets to be assessed. The coverage is uneven across goals, with health and education having at least one indicator per target, while oceans are only covered in a very limited way (Figure 2, Panel A). Coverage of the Agenda’s 5Ps - People (Goals 1, 2, 3, 4 and 5), Planet (Goals 6, 12, 13, 14 and 15), Prosperity (Goals 6, 12, 13, 14, 15), Peace (Goal 16) and Partnerships (Goal 17) – is somewhat less uneven, as shown by Figure 2, Panel B.

![Figure 2. Share of targets covered by at least one indicator](image)

Percentage of targets covered by Goal (Panel A, left) and the 5Ps (Panel B, right), all OECD countries

30. At the country level, data are generally available for the bulk of the indicators used in the Study: of the 35 OECD countries, 26 have data for 90% or more of the selected indicators. However, for a few countries – often those that have joined the OECD in recent years – data are missing for around 30% of the Study’s indicators (see Figure 3 for the range of country coverages of the 169 targets).
31. The information gaps should be borne in mind, especially when evaluating performance on the less well covered goals. They point to the need to further build statistical capacity to measure the targets not currently covered by OECD or UN indicators. Another possibility would be to depart more significantly from the IAEG Global List and use the best available proxies as placeholders, as several OECD countries have done to establish their national set of reporting indicators (see also next section).

32. The future statistical agenda on SDGs will have to increasingly concentrate on policy levers and global contributions. For the latter in particular, it will be important to identify spill-overs from domestic policies contemplated in the Agenda 2030 (e.g. attracting high-skilled immigrants may mean brain drain and human capital reduction in poorer countries).

33. Given its expertise on policy indicators (e.g. macro-economic and sectoral policies) and in measuring the interconnectedness among countries (e.g. ODA, trade access, Trade in Value Added, climate), the OECD is well placed to play a prominent role in moving this measurement agenda forward.

iii) From indicators to measuring distance to targets

34. The Study evaluates countries’ performance by examining the distance to travel in order to reach each target level. Here, the heterogeneous nature of SDG targets means that setting desirable levels of achievement by 2030 on each indicator requires a variety of approaches. The task is easy if the level is explicitly specified in the 2030 Agenda itself, either as a fixed value, or as a relative improvement on a country’s starting position. In other cases, a fixed value or a relative improvement can be deduced from other international agreements on the relevant topic. However, in a third category, where no guidance is available in international agreements, the Study has set the desirable value at the “90th percentile” – the level which only 10% of OECD countries now attain. This approach has not changed since the pilot version of the Study, but the numbers of indicators in each category has risen to the values shown in Table 2.

<td>36</td>
</tr>
</tbody>
</table>

35. In order to compare scores across different targets, indicators must be normalised. Initially, in the OECD pilot study (2016), indicator scores were placed on a common scale running from 0 to 100, with 100 being the end-value and 0 being the baseline level – the value that only 10% of OECD countries failed to reach in a defined base year (see Figure 4, Panel A). Setting such a baseline had the advantage of excluding “outliers” – unusually low scores that would otherwise unduly extend the scale. It also generated a good spread of results against possible target values, and could be applied to all targets, irrespective of their nature or complexity.

36. However, as the results are bounded between 0 and 100, this normalisation does not (by construction) enable one to monitor the performance of countries performing below the baseline. This limitation would also inhibit the application of the methodology to countries outside the OECD, many of which would fall short of the baseline on a large number of indicators. The zero bound might also be misinterpreted as the country’s starting point, whereas in fact it represents the 10th percentile of OECD country performance in the base year.

37. To overcome these problems, in response to comments received by countries, distances are now calculated as the “standardised difference” between the country’s current position and the target end-value. For each indicator, the standardised measurement units are defined as the standard deviation across OECD countries at the beginning of the period considered. To express a country’s starting position for a given indicator in standardised units, we first calculate the country’s distance to the target, and then divide this by the standard deviation of the indicator, for the distribution of OECD countries. Based on this approach, a score of zero implies that the target has been reached, while a positive (non-zero) score implies that a country has not yet achieved its target (see Figure 4, Panel B). Negative scores, which mean that a country has already exceeded the target, are reported as zero, i.e. as meeting the target. So the higher the score, the further is the distance that the country will need to travel to achieve its target. The units of measurement should be read as the number of standard deviations by which a country needs to improve in order to reach the target.

---

7. Example: target 5.5 on women’s full and effective participation in leadership is measured through the share of seats in national parliaments held by women. The level to be achieved by 2030 is 50%, as the target is full gender equality. The standard deviation of the shares currently observed among OECD country scores is ~10 percentage points. Denmark’s share of seats held by women is 37%. So its standardised score on this indicator is the difference between its current share (37%) and the target (50%), divided by the standard deviation (10%) = 13/10 = 1.3 units.
Figure 4. Illustrating current and former normalisation procedures

Panel A – the ratio scale

Panel B – the “standardised difference”

Note: The panels show the original and latest normalisation procedures for the same notional set of country scores on an indicator. Blue dot: score of assessed country. Grey dots: other country scores. Green line: target level to be achieved by 2030. Red line in Panel A: the “baseline level”, i.e. the value that only 10% of OECD countries currently fail to reach. Panel A shows the country as 20% of the way from the baseline to the target level. Panel B shows it is four standard deviations short of the target, this unit taking account of the position of all dots on the line.

38. This standardisation technique is a modified version of the standard “z-score” normalisation, which is one of the most common techniques used in statistics for comparing scores on different tests or constructing composites combining variables expressed in different measurement units. This standardisation method was tested against alternatives and preferred due to its statistical properties. Table 2 summarises conclusions from this testing, which included both the original method (“Ratio scale”) and the “time-distance” method. Time-distance simply estimates the number of years it will take to reach the target level on an indicator, given recent observed progress. Such progress can be assumed to be following a linear trend, or some other pattern, such as an annual percentage change (which yields an exponential trend). Overall, the modified z-score was preferred, especially because it enables measurement of progress by countries below the previous OECD baseline level while at the same time being relatively unaffected by the inclusion of additional countries in the sample. More information on the robustness tests carried out on various standardisation techniques, as well as the distributional effects on the distance results is provided in Boarini et al. (2017), forthcoming.

39. To assess performance by target, goal and “P”, results are summed by weighting each indicator equally within targets, weighting each target equally within goals, and weighting each goal equally within each “P”. This reflects the equal emphasis given to each of the Goals and 5Ps in the 2030 Agenda, but note that where goals have few indicators, it increases the weight of those indicators. The alternative of weighting each indicator equally would conversely reduce the weight of goals with few indicators.
4. **Study findings**

40. The Study finds that on average OECD countries have some distance to travel to reach the SDGs targets, particularly on the goals related to gender equality, education, the economy and jobs, and institutions. This partly reflects the more ambitious thresholds set on these targets (e.g. “achieving gender parity” vs. targets phrased only in terms of “substantially improve”). OECD countries are closer to meeting targets on water, biodiversity, cities, poverty and oceans. Figure 5 shows OECD average results by goal.

![Figure 5. OECD average results by Goal](image)

Note: This figure shows OECD’s distance to travel towards each of the 17 Goals of the 2030 Agenda. Bars show OECD’s performance. The y-axis indicates the distance from reaching the target in standardised units. 0 indicates that the level for 2030 has already been attained, and the axis starts at 3 as most OECD countries have already attained this level. Distances to target are aggregated at the goal level (all targets weighted equally).

41. Distances to targets vary significantly across the Goals (Figure 6), and when the goals are grouped into the 5Ps (Figure 7). OECD countries perform consistently well on water, biodiversity and infrastructure. There is more variation on poverty, women, sustainable production, climate and implementation, with some countries much nearer the 2030 levels than others. Of the 5Ps, Partnership shows the largest spread of country performance.
The Study shows that while individual countries’ performances tend to be fairly consistent across Goals, their performance within each Goal is often unbalanced. This suggests that, from the perspective of identifying strategic priorities for implementing the SDGs, countries should look at targets individually rather than just focusing on Goals. For instance, while all countries have already met the target of universal access to energy, many are lagging behind on renewable energy and even more so on energy efficiency (Figure 8).
Figure 8. How OECD countries vary in their distance to targets in Goal 7 - Energy

Note: The distribution of OECD countries’ distances on the four targets of Goal 7 for which indicators are available. Central black bars: OECD median country score. Box boundaries: first and third quartiles of the country distribution. Whiskers: 10th and 90th percentiles of this distribution.

43. For illustrative purposes, the OECD Study also makes a first attempt at distinguishing domestic targets from those with trans-boundary effects, i.e. positive or negative impacts of countries’ actions on the rest of the world. Such effects include help to other countries in meeting the targets, including through official development assistance (ODA). However, there may also be negative spillovers, such as when countries subsidise their own farmers in ways that reduce world prices or market access for developing countries. Demand for products consumed in OECD countries also entails carbon dioxide emissions in other parts of the world, which raises global greenhouse gas levels.

44. Figure 9 shows average OECD country performance against three types of targets with trans-boundary impacts. Countries are furthest from the 2030 targets on raising their demand-based CO₂ productivity (the goods consumed per unit of embodied emissions), whereas they are somewhat more advanced in reducing agricultural subsidies and increasing ODA. However, further work will be necessary to expand and deepen the analysis of trans-boundary aspects of OECD countries’ performance. The ways in which OECD countries aim to meet their domestic SDG targets may also have cross-border impacts, e.g. if health or education outcomes are improved partly with skilled personnel coming from developing countries.
The Study so far has been ‘static’, focusing on distances to travel rather than on rates of improvement. However, using past trends to project possible future performance could provide a key complement to assessing the starting positions, and also inform priority setting. For instance, if a country is very close to reaching a given target today, but has been slowing down or even reversing earlier progress, then in a few years it may lose its relative strength in that target and need to take action to achieve it. Dynamic assessments can also suggest the degree of effort required to meet a target, and how this varies across targets: where there is a long distance to travel, but recent progress has been rapid, it may be easier to close the gap than where the initial distance is short but recent progress has been slow or negative. The Study has therefore also been exploring Monte Carlo simulations for a selection of indicators where sufficient data on past performance is available. By way of example, Figure 10 shows observed and predicted fatal traffic accidents in Slovenia. The target is to reduce such deaths by half by 2020. The Monte Carlo simulations indicate that, based on past trends, there is only about a 30% chance of this being achieved by the deadline, though it is much more likely to be achieved by 2030 (right panel).

**Figure 10. Observed and predicted fatal traffic accidents - Slovenia**

Note: Left panel: Slovenian traffic accidents in standard deviation units, with zero representing the 2030 target level. Black line shows actual data to 2010. Blue lines show projected values to 2030, the solid line representing the most likely path based on past performance, and the dotted lines the 95% confidence interval, based on Monte-Carlo simulations. Right panel: The probability of achieving the 2030 targeted reduction of Slovenian traffic accidents in each year from 2015 to 2030, based on the Monte Carlo simulations, from zero (impossibility) to 1 (certainty).
A final consideration is that, as the Agenda asserts, the SDGs are indivisible and integrated. This means that achieving one Goal may require action on others. For instance, poverty reduction is the objective of Goal 1 but attaining it may also require progress e.g. under Goal 9, on the economy and decent work and Goal 10 on inequalities. In other cases, mutual dependence is observed: improving education (Goal 4) will bring benefits in terms of health status (Goal 3), income and employment (Goals 1, 2, 8 and 10), and institutions (Goal 16), but improvements in these factors could also improve educational resources and outcomes. In principle this calls for an integrated assessment of countries’ starting positions, in line with the conceptual approach suggested by the OECD Policy Coherence for Sustainable Development framework (http://dx.doi.org/10.1787/9789264256996-en). In practice, however, an integrated assessment is very complex to carry out, as the identification of synergies and trade-offs for many of the SDG targets is an empirical question that has been little researched so far. The Secretariat has conducted exploratory work to Study the correlations across targets and goals, using the dataset of the Study as well as SDG indicator sets developed by other institutions (e.g. the UN, the World Bank, etc.). Further work in this direction will be pursued in the future.

5. How participating countries have been using the Study

As explained by the UN’s Synthesis of Voluntary National Reviews at the 2016 High Level Political Forum, countries’ responses to SDGs vary widely and many national implementation plans are still in their infancy. Tasks include: i) translating SDGs into the national context; ii) developing monitoring and reporting frameworks; iii) building institutional frameworks to support a whole-of-government SDG implementation effort; iv) raising awareness and stakeholder involvement; and v) securing sufficient means of implementation.

The Study aimed especially to help countries with i) and ii) above, and has proven useful both in these respects and in others. Several countries are using the results of the Study to inform the national policy debate, especially in determining priorities for action in new or updated National Development Strategies or implementation plans or policy mechanisms. Slovenia for instance is building its National Development Strategy around several of the priorities highlighted by the Study such as the need to increase trust in institutions and the quality of governance more generally. In the Netherlands, the Council of Ministers published a letter to Parliament proposing to develop an action plan on SDGs for the coming years; the letter referred to the results of the OECD Study to indicate possible areas for improvement (see Annex II for detailed country results from the Study). The Czech Republic plans to refer to the Study results when preparing the implementation plan for the 2030 strategic framework that will be prepared by the end of November 2017.

Participating countries are also using the Study to guide their monitoring and reporting processes, and in particular to: i) select national indicators; ii) establish starting positions and finishing lines; and iii) developing dynamic baselines. Slovenia, Italy, Belgium and the Czech Republic, for instance, have used the Study methodology in their work to test the robustness of indicators and normalisation choices, or to study static versus dynamic baselines. The Czech Republic also envisages using the Study methodology as a tool for identifying policy gaps and highlighting changes needed to meet the 2030 Goals. In building its national reporting framework, Luxembourg is considering the indicator set used by the Study alongside other national and international indicator sets.

Some countries have also expressed an interest in referring to some of the results of the OECD Study in their National Voluntary Reviews at the annual High Level Policy Forum held in New York in July. So far, these countries include Slovenia, Latvia and the Czech Republic.

Finally, many countries valued participation in the Study as an opportunity to share experiences on design and communication of SDG plans. These experiences are particularly valuable to help build new institutional frameworks for a whole-of-government effort on SDGs, and to facilitate stakeholder involvement. In Slovenia, for instance, the elaboration of the National
Development Strategy used a participatory process with many governmental and non-governmental stakeholders, and the Study proved valuable in presenting the country’s SDG starting positions in a comparative perspective.

52. The uses of the Study vary partly in response to the different roles that national statistical offices (NSOs) play in SDG implementation in different countries, which in turn depend to some extent on the structure and nature of approaches to SDG implementation by the government system as a whole. Useful information on these approaches is available in an OECD Survey on Planning and Co-ordinating the Implementation of the SDGs conducted by a team of Swedish researchers in 2016. It found that most of the 33 countries surveyed were involving their NSOs in developing indicators to monitor implementation of SDGs, but that only some had done stocktaking or gap analysis of their country’s starting positions in addressing SDG-relevant issues.

53. The OECD/Swedish Study also showed that lead responsibility for SDG implementation among the surveyed countries was split evenly among three main models: leadership by the Centre of Government (CoG, i.e. Prime Minister’s office or department); co-leadership between the CoG and another ministry (most often the foreign ministry); and leadership or co-leadership without the centre of government (usually involving the foreign ministry). The CSSP meeting provides NSOs with an opportunity to share and compare their experiences under these different approaches to SDG implementation.

6. Conclusion

54. This Study on Measuring Distance to the SDG targets has been undertaken to assist member countries with their national implementation of the 2030 Agenda for Sustainable Development. Drawing on the IAEG Global List of indicators, its methodology evaluates the distance countries need to travel to meet each target. It can thus provide a high-level overview of strengths and weaknesses across the SDGs and the 5Ps, as well as a more granular analysis. While major data gaps remain – which the OECD is working with UN and other partners to fill – the pilot version of the Study has proven useful to several members in identifying areas that require attention in order to reach the 2030 targets. Work will continue to enable a more in-depth analysis of the targets to be achieved and the trajectories implied in specific country contexts.

55. Based on 131 indicators covering 98 targets, the Study shows that the OECD area as a whole still has significant distance to travel to meet the 2030 targets. On average, OECD countries are closest to reaching the 2030 targets on health, water and energy, and furthest away on gender equality. There is considerable heterogeneity in starting positions across both goals and targets, which suggests that national priorities for implementing SDG agendas should be set at target level.

Note: These indicators were selected after consideration of the UN Global indicator framework and according to the criteria discussed in section 4. (*) the target is set as the level prevailing in the top 10% of OECD countries with the best performance. (**) the target is set as a fraction or multiple of the score of the OECD median country in the reference year. UN-STAT - refers to indicators coming from the SDG Indicators Global Database (https://unstats.un.org/sdgs/indicators/database)
MEASURING DISTANCE TO THE SDGs TARGETS – BELGIUM

Based on the 126 available indicators allowing coverage of 93 of the 169 SDG targets, Belgium has currently achieved 11 of the 2030 targets. The remaining distances to achieve the targets are small in several areas, but challenges remain (Figure 1).

Figure 1. Belgium’s current distance from achieving SDGs’ 2030 targets

Note: The chart shows how far Belgium has already progressed towards each available target. The longer the bars the shorter the distance is to be travelled by 2030. Targets are clustered by goal, and goals are clustered by the “5Ps” of the 2030 Agenda (outer circle).

These results rely on the best comparative indicators currently available in various OECD and UN databases, in line with the UN global indicator framework. However, a number of important data gaps need to be addressed to enable a more complete assessment. For Belgium, health and education are the only goals with full target coverage while sustainable production, oceans and cities have less than 30% of their targets covered (Figure 2).

Figure 2. The statistical agenda ahead: Belgium’s data coverage
Percentage of targets for which there is at least one indicator by goals and the 5Ps of the 2030 Agenda, compared with the OECD total

Note: The global indicator framework developed by the UN Inter-Agency and Expert Group on SDG Indicators and adopted by the UN Statistical Commission in March 2017 agreed upon 232 indicators to measure the 169 targets. Reflecting data availability, this study considers 131 indicators covering 98 targets.
Belgium is on average closest to reaching goals on water and oceans (Goals 6 and 14). It also has very good outcomes in some of the Prosperity goals as well as on Partnerships (Figure 3).

Relative to the OECD average, Belgium outperforms on goals such as gender equality and implementation (Goals 4 and 17), and is either ahead of, or fairly close to, the OECD average distance on many other goals (Figure 3). The main exception to this are sustainable production and climate (Goals 12 and 13), and to a lesser extent on most Planet goals, where performance is below the OECD average.

![Figure 3. Belgium’s current distance from reaching the goals and the 5Ps of the 2030 Agenda, compared with the OECD average](image)

**GLOBAL CONTRIBUTION TO THE 2030 AGENDA**

Belgium’s performance on some SDG targets pertaining to global contributions

Indicators can also be grouped to examine OECD countries’ global contribution to the 2030 Agenda. This may help countries consider how they influence – positively or negatively, intentionally or unintentionally – the ability of other countries to achieve their goals.

As a starting point, this study considers Official Development Assistance (ODA), support to national agricultural producers, and demand-based CO2 productivity. Future work will aim to develop a fuller assessment, considering a wider range of “transboundary” impacts.

Belgium performs around the OECD average in terms of ODA flows but is further away from meeting target on demand-based CO2 productivity. Data on producer support (i.e. subsidies to agricultural producers) are not available.

![GLOBAL CONTRIBUTION TO THE 2030 AGENDA](image)
MEASURING DISTANCE TO THE SDGs TARGETS – THE CZECH REPUBLIC

Based on the 128 available indicators allowing coverage of 95 of the 169 SDG targets, the Czech Republic has currently achieved 15 of the 2030 targets. The remaining distances to achieve the targets are small in several areas, but challenges remain (Figure 1).

**Figure 1. The Czech Republic’s current distance from achieving SDGs’ 2030 targets**

Note: The chart shows how far the Czech Republic has already progressed towards each available target. The longer the bars the shorter the distance is to be travelled by 2030. Targets are clustered by goal, and goals are clustered by the “5Ps” of the 2030 Agenda (outer circle).

These results rely on the best comparative indicators currently available in various OECD and UN databases, in line with the UN global indicator framework. However, a number of important data gaps need to be addressed to enable a more complete assessment. For the Czech Republic, health and education are the only goals with full target coverage while sustainable production, oceans and cities have less than 30% of their targets covered (Figure 2).

**Figure 2. The statistical agenda ahead: the Czech Republic’s data coverage**
Percentage of targets for which there is at least one indicator by goals and the 5Ps of the 2030 Agenda, compared with the OECD total

Note: The global indicator framework developed by the UN Inter-Agency and Expert Group on SDG Indicators and adopted by the UN Statistical Commission in March 2017 agreed upon 232 indicators to measure the 169 targets. Reflecting data availability, this study considers 131 indicators covering 98 targets.
The Czech Republic is on average closest to reaching all goals in the Planet category (Figure 3). It also has very good outcomes in some of the Prosperity goals as well as on poverty. However, it is further away from reaching other goals, most notably on gender equality, food and education (Goals 5, 2 and 4, respectively).

Relative to the OECD average, the Czech Republic outperforms on goals such as biodiversity and poverty (Goals 15 and 1), and is either ahead of, or fairly close to, the OECD average distance on several other goals (Figure 3). The main exceptions to this are gender equality and energy, and to a lesser extent food, health, climate and the means of implementation (Goals 5, 7, 2, 3, 13 17 respectively), where performance is below the OECD average.

**Figure 3. The Czech Republic’s current distance from reaching the goals and the 5Ps of the 2030 Agenda, compared with the OECD average**

Note: This figure shows The Czech Republic’s distance to travel towards each of the 17 goals of the 2030 Agenda. Bars show The Czech Republic’s performance, while diamonds show the OECD average. White bars indicate missing data. The y-axis indicates the distance from reaching the target in standardised units. 0 indicates that the level for 2030 has already been attained, and the axis starts at 3 as most OECD countries have already attained this level. Distances to target are aggregated at the goal level (all targets weighted equally). To make the level of achievement within the country more distinct, in this figure, data on Official Development Assistance (ODA) are excluded in Goals 1 to 16. Nonetheless, total ODA, ODA focusing on capacity building and national planning as well as ODA commitments to statistical capacity building are included in Goal 17 “implementation” and under Partnership.

**GLOBAL CONTRIBUTION TO THE 2030 AGENDA**

The Czech Republic’s performance on some SDG targets pertaining to global contributions

Indicators can also be grouped to examine OECD countries’ global contribution to the 2030 Agenda. This may help countries consider how they influence – positively or negatively, intentionally or unintentionally – the ability of other countries to achieve their goals.

As a starting point, this study considers Official Development Assistance (ODA), support to national agricultural producers, and demand-based CO2 productivity. Future work will aim to develop a fuller assessment, considering a wider range of “transboundary” impacts.

The Czech Republic performs significantly below the OECD average in terms of ODA flows and demand-based CO2 productivity. Data on producer support (i.e. subsidies to agricultural producers) are not available.

Note: This figure shows the Czech Republic’s distance to travel towards some SDG targets pertaining to global contributions. Bars show the Czech Republic’s performance while diamonds show the OECD average. White bars indicate missing data.
Based on the 127 available indicators allowing coverage of 94 of the 169 SDG targets, Denmark has currently achieved 26 of the 2030 targets. The remaining distances to achieve the targets are small in most areas, but some challenges remain (Figure 1).

**Figure 1. Denmark’s current distance from achieving SDGs’ 2030 targets**

Note: The chart shows how far Denmark has already progressed towards each available target. The longer the bars the shorter the distance is to be travelled by 2030. Targets are clustered by goal, and goals are clustered by the “5Ps” of the 2030 Agenda (outer circle).

These results rely on the best comparative indicators currently available in various OECD and UN databases, in line with the UN global indicator framework. However, a number of important data gaps need to be addressed to enable a more complete assessment. For Denmark, health and education are the only goals with full target coverage while sustainable production, oceans and cities have less than 30% of their targets covered (Figure 2).

**Figure 2. The statistical agenda ahead: Denmark’s data coverage**

Percentage of targets for which there is at least one indicator by goals and the 5Ps of the 2030 Agenda, compared with the OECD total

Note: The global indicator framework developed by the UN Inter-Agency and Expert Group on SDG Indicators and adopted by the UN Statistical Commission in March 2017 agreed upon 232 indicators to measure the 169 targets. Reflecting data availability, this study considers 131 indicators covering 98 targets.
Denmark is on average closest to reaching all goals in the Planet category (Figure 3). It also has very good outcomes in most of the Prosperity goals as well as on Partnership. However, it is further away from reaching other goals, most notably on gender equality (Goal 5).

Relative to the OECD average, Denmark outperforms on most goals such as poverty, energy and implementation (Goals 1, 7 and 17), and is around the OECD average distance on a few other goals (Figure 3).

**Figure 3. Denmark's current distance from reaching the goals and the 5Ps of the 2030 Agenda, compared with the OECD average**

Note: This figure shows Denmark’s distance to travel towards each of the 17 goals of the 2030 Agenda. Bars show Denmark’s performance, while diamonds show the OECD average. White bars indicate missing data. The y-axis indicates the distance from reaching the target in standardised units. 0 indicates that the level for 2030 has already been attained, and the axis starts at 3 as most OECD countries have already attained this level. Distances to target are aggregated at the goal level (all targets weighted equally). To make the level of achievement within the country more distinct, in this figure, data on Official Development Assistance (ODA) are excluded in Goals 1 to 16. Nonetheless, total ODA, ODA focusing on capacity building and national planning as well as ODA commitments to statistical capacity building are included in Goal 17 “implementation” and under Partnership.

**GLOBAL CONTRIBUTION TO THE 2030 AGENDA**

**Denmark’s performance on some SDG targets pertaining to global contributions**

Indicators can also be grouped to examine OECD countries’ global contribution to the 2030 Agenda. This may help countries consider how they influence – positively or negatively, intentionally or unintentionally – the ability of other countries to achieve their goals.

As a starting point, this study considers Official Development Assistance (ODA), support to national agricultural producers, and demand-based CO₂ productivity. Future work will aim to develop a fuller assessment, considering a wider range of “transboundary” impacts.

Denmark performs above the OECD average in terms of ODA flows and demand-based CO₂ productivity. Data on producer support (i.e. subsidies to agricultural producers) are not available.

Note: This figure shows Denmark’s distance to travel towards some SDG targets pertaining to global contributions. Bars show Denmark’s performance while diamonds show the OECD average. White bars indicate missing data.
Based on the 130 available indicators allowing coverage of 97 of the 169 SDG targets, Finland has currently achieved 23 of the 2030 targets. The remaining distances to achieve the targets are small in several areas, but challenges remain (Figure 1).

Figure 1. Finland’s current distance from achieving SDGs’ 2030 targets

Note: The chart shows how far Finland has already progressed towards each available target. The longer the bars the shorter the distance is to be travelled by 2030. Targets are clustered by goal, and goals are clustered by the “5Ps” of the 2030 Agenda (outer circle).

These results rely on the best comparative indicators currently available in various OECD and UN databases, in line with the UN global indicator framework. However, a number of important data gaps need to be addressed to enable a more complete assessment. For Finland, health and education are the only goals with full target coverage while sustainable production, oceans and cities have less than 30% of their targets covered (Figure 2).

Figure 2. The statistical agenda ahead: Finland’s data coverage

To make the level of achievement within the country more distinct, in this figure, data on Official Development Assistance (ODA) are excluded in Goals 1 to 16. Nonetheless, total ODA, ODA focusing on capacity building and national planning as well as ODA commitments to statistical capacity building are included in Goal 17 “implementation” and under Partnership.

### GLOBA L CONTRIBUTION TO THE 2030 AGENDA

Finland’s performance on some SDG targets pertaining to global contributions

Indicators can also be grouped to examine OECD countries’ global contribution to the 2030 Agenda. This may help countries consider how they influence – positively or negatively, intentionally or unintentionally – the ability of other countries to achieve their goals.

As a starting point, this study considers Official Development Assistance (ODA), support to national agricultural producers, and demand-based CO₂ productivity. Future work will aim to develop a fuller assessment, considering a wider range of “transboundary” impacts.

Finland performs around the OECD average in terms of ODA flows but is below average on demand-based CO₂ productivity. Data on producer support (i.e. subsidies to agricultural producers) are not available.

![Note: This figure shows Finland’s distance to travel towards some SDG targets pertaining to global contributions. Bars show Finland’s performance while diamonds show the OECD average. White bars indicate missing data.](image)
Based on the 128 available indicators allowing coverage of 96 of the 169 SDG targets, Italy has currently achieved 11 of the 2030 targets. In several areas, the remaining distances to achieve the targets are small, but challenges remain (Figure 1).

**Figure 1. Italy’s current distance from achieving SDGs’ 2030 targets**

These results rely on the best comparative indicators currently available in various OECD and UN databases, in line with the UN global indicator framework. However, a number of important data gaps need to be addressed to enable a more complete assessment. For Italy, health and education are the only goals with full target coverage while sustainable production, oceans and cities have less than 30% of their targets covered (Figure 2).

**Figure 2. The statistical agenda ahead: Italy’s data coverage**

Percentage of targets for which there is at least one indicator by goals and the 5Ps of the 2030 Agenda, compared with the OECD total

Note: The global indicator framework developed by the UN Inter-Agency and Expert Group on SDG Indicators and adopted by the UN Statistical Commission in March 2017 agreed upon 232 indicators to measure the 169 targets. Reflecting data availability, this study considers 131 indicators covering 98 targets.
Italy is on average closest to reaching all goals in the Planet category (Figure 3). It also has very good outcomes in the energy goal (Goal 7). However, it is further away from reaching other goals, most notably on education and economy (Goals 4 and 8).

Relative to the OECD average, Italy outperforms on goals such as sustainable production and climate (Goals 12 and 13), and is either ahead of, or fairly close to, the OECD average distance on some other goals (Figure 3). The main exceptions to this are education, economy and institutions, and to a lesser extent poverty, water and implementation, where performance is below the OECD average (Goals 4, 8, 16, 1, 6, and 17, respectively).

**Figure 3. Italy’s current distance from reaching the goals and the 5Ps of the 2030 Agenda, compared with the OECD average**

Note: This figure shows Italy’s distance to travel towards each of the 17 goals of the 2030 Agenda. Bars show Italy’s performance, while diamonds show the OECD average. White bars indicate missing data. The y-axis indicates the distance from reaching the target in standardised units. 0 indicates that the level for 2030 has already been attained, and the axis starts at 3 as most OECD countries have already attained this level. Distances to target are aggregated at the goal level (all targets weighted equally). To make the level of achievement within the country more distinct, in this figure, data on Official Development Assistance (ODA) are excluded in Goals 1 to 16. Nonetheless, total ODA, ODA focusing on capacity building and national planning as well as ODA commitments to statistical capacity building are included in Goal 17 “implementation” and under Partnership.

**GLOBAL CONTRIBUTION TO THE 2030 AGENDA**

**Italy’s performance on some SDG targets pertaining to global contributions**

Indicators can also be grouped to examine OECD countries’ global contribution to the 2030 Agenda. This may help countries consider how they influence – positively or negatively, intentionally or unintentionally – the ability of other countries to achieve their goals.

As a starting point, this study considers Official Development Assistance (ODA), support to national agricultural producers, and demand-based CO₂ productivity. Future work will aim to develop a fuller assessment, considering a wider range of “transboundary” impacts.

Italy performs below the OECD average in terms of ODA flows but is slightly above the average on demand-based CO₂ productivity. Data on producer support (i.e. subsidies to agricultural producers) are not available.

Note: This figure shows Italy’s distance to travel towards some SDG targets pertaining to global contributions. Bars show Italy’s performance while diamonds show the OECD average. White bars indicate missing data.
Based on the 119 available indicators allowing coverage of 88 of the 169 SDG targets, Korea has currently achieved 12 of the 2030 targets. In some targets, the remaining distances to achieve are small, but a number of challenges remain (Figure 1).

Figure 1. Korea's current distance from achieving SDGs' 2030 targets

Note: The chart shows how far Korea has already progressed towards each available target. The longer the bars the shorter the distance is to be travelled by 2030. Targets are clustered by goal, and goals are clustered by the “5Ps” of the 2030 Agenda (outer circle).

These results rely on the best comparative indicators currently available in various OECD and UN databases, in line with the UN global indicator framework. However, a number of important data gaps need to be addressed to enable a more complete assessment. For Korea, health is the only goal with full target coverage while sustainable production, oceans, inequality and cities have less than 30% of their targets covered (Figure 2).

Figure 2. The statistical agenda ahead: Korea's data coverage
Percentage of targets for which there is at least one indicator by goals and the 5Ps of the 2030 Agenda, compared with the OECD total

Note: The global indicator framework developed by the UN Inter-Agency and Expert Group on SDG Indicators and adopted by the UN Statistical Commission in March 2017 agreed upon 232 indicators to measure the 169 targets. Reflecting data availability, this study considers 131 indicators covering 98 targets.
Korea is on average closest to reaching some goals in the Planet category (Figure 3). It also has very good outcomes in infrastructure and to a lesser extent, economy (Goals 9 and 8). However, it is further away from reaching other goals, most notably on poverty, gender equality, climate and inequality (Goals 1 and 8).

Relative to the OECD average, Korea outperforms on goals such as education, sustainable production, economy and infrastructure (Goals 4, 12, 8 and 9). The performance is however below the OECD average in many other goals, most notably on poverty, gender equality, climate, inequality but also cities (Goals 1, 5, 13 and 11).

Figure 3. Korea’s current distance from reaching the goals and the 5Ps of the 2030 Agenda, compared with the OECD average

Note: This figure shows Korea’s distance to travel towards each of the 17 goals of the 2030 Agenda. Bars show Korea’s performance, while diamonds show the OECD average. White bars indicate missing data. The y-axis indicates the distance from reaching the target in standardised units. 0 indicates that the level for 2030 has already been attained, and the axis starts at 3 as most OECD countries have already attained this level. Distances to target are aggregated at the goal level (all targets weighted equally). To make the level of achievement within the country more distinct, in this figure, data on Official Development Assistance (ODA) are excluded in Goals 1 to 16. Nonetheless, total ODA, ODA focusing on capacity building and national planning as well as ODA commitments to statistical capacity building are included in Goal 17 “implementation” and under Partnership.

GLOBAL CONTRIBUTION TO THE 2030 AGENDA

Korea’s performance on some SDG targets pertaining to global contributions

Indicators can also be grouped to examine OECD countries’ global contribution to the 2030 Agenda. This may help countries consider how they influence – positively or negatively, intentionally or unintentionally – the ability of other countries to achieve their goals.

As a starting point, this study considers Official Development Assistance (ODA), support to national agricultural producers, and demand-based CO₂ productivity. Future work will aim to develop a fuller assessment, considering a wider range of “transboundary” impacts.

Korea’s performance in terms of ODA flows is close to the OECD average. Korea is, however, further from meeting targets on demand-based CO₂ productivity and on producer support (i.e. subsidies to agricultural producers are higher than average).
MEASURING DISTANCE TO THE SDGs TARGETS – LATVIA

Based on the 90 available indicators allowing coverage of 66 of the 169 SDG targets, Latvia has currently achieved 11 of the 2030 targets. The remaining distances to achieve the targets are small in some areas, but several challenges remain (Figure 1).

**Figure 1. Latvia’s current distance from achieving SDGs’ 2030 targets**

Note: The chart shows how far Latvia’s has already progressed towards each available target. The longer the bars the shorter the distance is to be travelled by 2030. Targets are clustered by goal, and goals are clustered by the “5Ps” of the 2030 Agenda (outer circle).

These results rely on the best comparative indicators currently available in various OECD and UN databases, in line with the UN global indicator framework. However, a number of important data gaps need to be addressed to enable a more complete assessment. For Latvia, there is no goal with full target coverage while sustainable production, climate, oceans, biodiversity, cities and implementation have less than 30% of their targets covered (Figure 2).

**Figure 2. The statistical agenda ahead: Latvia’s data coverage**
Percentage of targets for which there is at least one indicator by goals and the 5Ps of the 2030 Agenda, compared with the OECD total

Note: The global indicator framework developed by the UN Inter-Agency and Expert Group on SDG Indicators and adopted by the UN Statistical Commission in March 2017 agreed upon 232 indicators to measure the 169 targets. Reflecting data availability, this study considers 131 indicators covering 98 targets.
Latvia is on average closest to reaching some goals in the Planet category (Figure 3). It also has very good outcomes in some of the Prosperity goals. However, it is further away from reaching other goals, most notably on poverty and health (Goals 1 and 3).

Relative to the OECD average, Latvia outperforms on goals such as economy, biodiversity and cities (Goals 8, 15 and 11), and is either ahead of, or fairly close to, the OECD average distance on some other goals (Figure 3). However, on poverty, and to a lesser extent health, water and sustainable production, performance is significantly below the OECD average (Goals 1, 2, 6 and 12).

Figure 3. Latvia’s current distance from reaching the goals and the 5Ps of the 2030 Agenda, compared with the OECD average

Note: This figure shows Latvia’s distance to travel towards each of the 17 goals of the 2030 Agenda. Bars show Latvia’s performance, while diamonds show the OECD average. White bars indicate missing data. The y-axis indicates the distance from reaching the target in standardised units. 0 indicates that the level for 2030 has already been attained, and the axis starts at 3 as most OECD countries have already attained this level. Distances to target are aggregated at the goal level (all targets weighted equally). To make the level of achievement within the country more distinct, in this figure, data on Official Development Assistance (ODA) are excluded in Goals 1 to 16. Nonetheless, total ODA, ODA focusing on capacity building and national planning as well as ODA commitments to statistical capacity building are included in Goal 17 “implementation” and under Partnership.

GLOBAL CONTRIBUTION TO THE 2030 AGENDA

Latvia’s performance on some SDG targets pertaining to global contributions

Indicators can also be grouped to examine OECD countries’ global contribution to the 2030 Agenda. This may help countries consider how they influence – positively or negatively, intentionally or unintentionally – the ability of other countries to achieve their goals.

As a starting point, this study considers Official Development Assistance (ODA), support to national agricultural producers, and demand-based CO₂ productivity. Future work will aim to develop a fuller assessment, considering a wider range of “transboundary” impacts.

Latvia performs below the OECD average in terms of ODA flows (it should be noted that Latvia is not part of the Development Assistance Committee). Latvia is performing around average on demand-based CO₂ productivity. Data on producer support (i.e. subsidies to agricultural producers) are not available.
Based on the 120 available indicators allowing coverage of 87 of the 169 SDG targets, Luxembourg has currently achieved 19 of the 2030 targets. The remaining distances to achieve the targets are small in many areas, but some challenges remain (Figure 1).

**Figure 1. Luxembourg’s current distance from achieving SDGs’ 2030 targets**

Note: The chart shows how far Luxembourg has already progressed towards each available target. The longer the bars the shorter the distance is to be travelled by 2030. Targets are clustered by goal, and goals are clustered by the “5Ps” of the 2030 Agenda (outer circle).

These results rely on the best comparative indicators currently available in various OECD and UN databases, in line with the UN global indicator framework. However, a number of important data gaps need to be addressed to enable a more complete assessment. For Luxembourg, health is the only goal with full target coverage while sustainable production, oceans and cities have less than 30% of their targets covered (Figure 2).

**Figure 2. The statistical agenda ahead: Luxembourg’s data coverage**

Note: The global indicator framework developed by the UN Inter-Agency and Expert Group on SDG Indicators and adopted by the UN Statistical Commission in March 2017 agreed upon 232 indicators to measure the 169 targets. Reflecting data availability, this study considers 131 indicators covering 98 targets.
Luxembourg is on average closest to reaching all goals in the Planet category (Figure 3). It also has very good outcomes in some of the goals in other categories, such as poverty and implementation (Goals 1 and 17). However, it is further away from reaching other goals, most notably on food and gender equality (Goals 2 and 5).

Relative to the OECD average, Luxembourg outperforms on many goals such as sustainable production and education (Goals 12 and 4), and is either ahead of, or fairly close to, the OECD average distance on many other goals (Figure 3). The main exception to this is food, and to a lesser extent gender equality, climate and cities, where performance is below the OECD average (Goals 2, 5, 13 and 11, respectively).

Figure 3. Luxembourg’s current distance from reaching the goals and the 5Ps of the 2030 Agenda, compared with the OECD average

Note: This figure shows Luxembourg distance to travel towards each of the 17 goals of the 2030 Agenda. Bars show Luxembourg performance, while diamonds show the OECD average. White bars indicate missing data. The y-axis indicates the distance from reaching the target in standardised units. 0 indicates that the level for 2030 has already been attained, and the axis starts at 3 as most OECD countries have already attained this level. Distances to target are aggregated at the goal level (all targets weighted equally). To make the level of achievement within the country more distinct, in this figure, data on Official Development Assistance (ODA) are excluded in Goals 1 to 16. Nonetheless, total ODA, ODA focusing on capacity building and national planning as well as ODA commitments to statistical capacity building are included in Goal 17 “implementation” and under Partnership.

GLOBAL CONTRIBUTION TO THE 2030 AGENDA

Luxembourg’s performance on some SDG targets pertaining to global contributions

Indicators can also be grouped to examine OECD countries’ global contribution to the 2030 Agenda. This may help countries consider how they influence – positively or negatively, intentionally or unintentionally – the ability of other countries to achieve their goals.

As a starting point, this study considers Official Development Assistance (ODA), support to national agricultural producers, and demand-based CO2 productivity. Future work will aim to develop a fuller assessment, considering a wider range of “transboundary” impacts.

Luxembourg performs significantly above the OECD average in terms of ODA flows and demand-based CO2 productivity. Data on producer support (i.e. subsidies to agricultural producers) are not available.

Note: This figure shows Luxembourg’s distance to travel towards some SDG targets pertaining to global contributions. Bars show Luxembourg’s performance while diamonds show the OECD average. White bars indicate missing data.
Based on the 128 available indicators, allowing coverage of 95 of the 169 SDG targets, the Netherlands has currently achieved 19 of the 2030 targets. The remaining distances to achieve the targets are small in many areas, but challenges remain (Figure 1).

Figure 1. The Netherlands’ current distance from achieving SDGs’ 2030 targets

These results rely on the best comparative indicators currently available in various OECD and UN databases, in line with the UN global indicator framework. However, a number of important data gaps need to be addressed to enable a more complete assessment. For the Netherlands, health and education are the only goals with full target coverage while sustainable production, oceans and cities have less than 30% of their targets covered (Figure 2).

Figure 2. The statistical agenda ahead: the Netherlands’ data coverage

Percentage of targets for which there is at least one indicator by goals and the 5Ps of the 2030 Agenda, compared with the OECD total

Note: The global indicator framework developed by the UN Inter-Agency and Expert Group on SDG Indicators and adopted by the UN Statistical Commission in March 2017 agreed upon 232 indicators to measure the 169 targets. Reflecting data availability, this Study considers 131 indicators covering 98 targets.
The Netherlands is on average closest to reaching all goals in the Planet category (Figure 3). It also has very good outcomes in some of the People goals as well as on Partnerships. However, it is further away from reaching other goals, most notably on gender equality.

Relative to the OECD average, the Netherlands outperforms on goals such as sustainable production and ending poverty, and is either ahead of, or fairly close to, the OECD average distance on many other goals (Figure 3). The main exception to this is gender equality, and to a lesser extent food and infrastructures (Goals 5, 2 and 9 respectively), where performance is below the OECD average.

**Figure 3. The Netherlands’ current distance from reaching the goals and the 5Ps of the 2030 Agenda, compared with the OECD average**

Note: Figure 3 above shows the Netherlands’ distance to travel towards each of the 17 goals of the 2030 Agenda. Bars show the Netherlands’ performance, while diamonds show the OECD average. White bars indicate missing data. The y-axis indicates the distance from reaching the target in standardised units. 0 indicates that the level for 2030 has already been attained, and the axis starts at 3 as most OECD countries have already attained this level. Distances to target are aggregated at the goal level (all targets weighted equally). To make the level of achievement within the country more distinct, in this figure, data on Official Development Assistance (ODA) are excluded in Goals 1 to 16. Nonetheless, total ODA, ODA focusing on capacity building and national planning as well as ODA commitments to statistical capacity building are included in Goal 17 “implementation” and under Partnership.

**GLOBAL CONTRIBUTION TO THE 2030 AGENDA**

The Netherlands’ performance on some SDG targets pertaining to global contributions

Indicators can also be grouped to examine OECD countries’ global contribution to the 2030 Agenda. This may help countries consider how they influence – positively or negatively, intentionally or unintentionally – the ability of other countries to achieve their goals.

As a starting point, this Study considers Official Development Assistance (ODA), support to national agricultural producers, and demand-based CO2 productivity. Future work will aim to develop a fuller assessment, considering a wider range of “transboundary” impacts.

The Netherlands performs above the OECD average in terms of ODA flows and demand-based CO2 productivity. Data on producer support (i.e. subsidies to agricultural producers) are not available.
Based on the 130 available indicators, allowing coverage of 98 of the 169 SDG targets, Norway has currently achieved 33 of the 2030 targets. The remaining distances to achieve the targets are small in several areas, but some challenges remain (Figure 1).

**Figure 1. Norway’s current distance from achieving SDGs’ 2030 targets**

Note: The chart shows how far Norway has already progressed towards each available target. The longer the bars the shorter the distance is to be travelled by 2030. Targets are clustered by goal, and goals are clustered by the “5Ps” of the 2030 Agenda (outer circle).

These results rely on the best comparative indicators currently available in various OECD and UN databases, in line with the UN global indicator framework. However, a number of important data gaps need to be addressed to enable a more complete assessment. For Norway, health and education are the only goals with full target coverage while sustainable production, oceans and cities have less than 30% of their targets covered (Figure 2).

**Figure 2. The statistical agenda ahead: Norway’s data coverage**

Percentage of targets for which there is at least one indicator by goals and the 5Ps of the 2030 Agenda, compared with the OECD total

Note: The global indicator framework developed by the UN Inter-Agency and Expert Group on SDG Indicators and adopted by the UN Statistical Commission in March 2017 agreed upon 232 indicators to measure the 169 targets. Reflecting data availability, this study considers 131 indicators covering 98 targets.
Norway is on average closest to reaching all goals in the Planet category (Figure 3). It also has very good outcomes in some of the People and Prosperity goals as well as on Partnerships. Relative to the OECD average, Norway outperforms on almost every goal, besides food and sustainable production (Goals 2 and 12) where performance is below the OECD average.

**Figure 3. Norway’s current distance from reaching the goals and the 5Ps of the 2030 Agenda, compared with the OECD average**

Note: This figure shows Norway’s distance to travel towards each of the 17 goals of the 2030 Agenda. Bars show Norway’s performance, while diamonds show the OECD average. White bars indicate missing data. The y-axis indicates the distance from reaching the target in standardised units. 0 indicates that the level for 2030 has already been attained, and the axis starts at 3 as most OECD countries have already attained this level. Distances to target are aggregated at the goal level (all targets weighted equally). To make the level of achievement within the country more distinct, in this figure, data on Official Development Assistance (ODA) are excluded in Goals 1 to 16. Nonetheless, total ODA, ODA focusing on capacity building and national planning as well as ODA commitments to statistical capacity building are included in Goal 17 “implementation” and under Partnership.

**GLOBAL CONTRIBUTION TO THE 2030 AGENDA**

Norway’s performance on some SDG targets pertaining to global contributions

Indicators can also be grouped to examine OECD countries’ global contribution to the 2030 Agenda. This may help countries consider how they influence – positively or negatively, intentionally or unintentionally – the ability of other countries to achieve their goals.

As a starting point, this study considers Official Development Assistance (ODA), support to national agricultural producers, and demand-based CO2 productivity. Future work will aim to develop a fuller assessment, considering a wider range of “transboundary” impacts.

Norway performs above the OECD average in terms of ODA flows and demand-based CO2 productivity but is significantly below average on producer support (i.e. subsidies to agricultural producers are much higher than average).
MEASURING DISTANCE TO THE SDGs TARGETS – THE SLOVAK REPUBLIC

Based on the 127 available indicators allowing coverage of 94 of the 169 SDG targets, the Slovak Republic has currently achieved 13 of the 2030 targets. The remaining distances to achieve the targets are small in several areas, but challenges remain (figure 1).

Figure 1. The Slovak Republic’s current distance from achieving SDGs’ 2030 targets

These results rely on the best comparative indicators currently available in various OECD and UN databases, in line with the UN global indicator framework. However, a number of important data gaps need to be addressed to enable a more complete assessment. For the Slovak Republic, health and education are the only goals with full target coverage while sustainable production, oceans and cities have less than 30% of their targets covered (figure 2).

Figure 2. The statistical agenda ahead: the Slovak Republic’s data coverage

Note: The global indicator framework developed by the UN Inter-Agency and Expert Group on SDG Indicators and adopted by the UN Statistical Commission in March 2017 agreed upon 232 indicators to measure the 169 targets. Reflecting data availability, this study considers 131 indicators covering 98 targets.
The Slovak Republic is on average closer to reaching most goals in the Planet category (Figure 3). It also has good outcomes in the goal on poverty (Goal 1). However, it is further away from reaching other goals, most notably on gender equality (Goal 5).

Relative to the OECD average, the Slovak Republic is either ahead of, or fairly close to, the OECD average distance on several goals, including poverty, climate change, inequality and institutions (Goals 1, 13, 10 and 16). The main exception to this are gender equality and infrastructures (Goals 5 and 9 respectively), where performance is well below the OECD average (Figure 3).

Figure 3. The Slovak Republic’s current distance from reaching the goals and the 5Ps of the 2030 Agenda, compared with the OECD average

Note: This figure shows the Slovak Republic’s distance to travel towards each of the 17 goals of the 2030 Agenda. Bars show the Slovak Republic’s performance, while diamonds show the OECD average. White bars indicate missing data. The y-axis indicates the distance from reaching the target in standardised units. 0 indicates that the level for 2030 has already been attained, and the axis starts at 3 as most OECD countries have already attained this level. Distances to target are aggregated at the goal level (all targets weighted equally). To make the level of achievement within the country more distinct, in this figure, data on Official Development Assistance (ODA) are excluded in Goals 1 to 16. Nonetheless, total ODA, ODA focusing on capacity building and national planning as well as ODA commitments to statistical capacity building are included in Goal 17 “implementation” and under Partnership.

GLOBAL CONTRIBUTION TO THE 2030 AGENDA

The Slovak Republic’s performance on some SDG targets pertaining to global contributions

Indicators can also be grouped to examine OECD countries’ global contribution to the 2030 Agenda. This may help countries consider how they influence – positively or negatively, intentionally or unintentionally – the ability of other countries to achieve their goals.

As a starting point, this study considers Official Development Assistance (ODA), support to national agricultural producers, and demand-based CO₂ productivity. Future work will aim to develop a fuller assessment, considering a wider range of “transboundary” impacts.

The Slovak Republic performs below the OECD average in terms of ODA flows and demand-based CO₂ productivity. Data on producer support (i.e. subsidies to agricultural producers) are not available.
Based on the 126 available indicators allowing coverage of 95 of the 169 SDG targets, Slovenia has currently achieved 12 of the 2030 targets. The remaining distances to achieve the targets are small in several areas, but challenges remain (Figure 1).

**Figure 1. Slovenia's current distance from achieving SDGs’ 2030 targets**

Note: The chart shows how far Slovenia has already progressed towards each available target. The longer the bars the shorter the distance is to be travelled by 2030. Targets are clustered by goal, and goals are clustered by the “5Ps” of the 2030 Agenda (outer circle).

These results rely on the best comparative indicators currently available in various OECD and UN databases, in line with the UN global indicator framework. However, a number of important data gaps need to be addressed to enable a more complete assessment. For Slovenia, health is the only goal with full target coverage while sustainable production, oceans and cities have less than 30% of their targets covered (Figure 2).

**Figure 2. The statistical agenda ahead: Slovenia’s data coverage**

Percentage of targets for which there is at least one indicator by goals and the 5Ps of the 2030 Agenda, compared with the OECD total

Note: The global indicator framework developed by the UN Inter-Agency and Expert Group on SDG Indicators and adopted by the UN Statistical Commission in March 2017 agreed upon 232 indicators to measure the 169 targets. Reflecting data availability, this study considers 131 indicators covering 98 targets.
Slovenia is on average closest to reaching all goals in the Planet category (Figure 3). It also has very good outcomes in goals such as poverty and cities, and does not have significant areas with very low outcomes at goal level.

Relative to the OECD average, Slovenia outperforms on goals such as gender equality and biodiversity (Goals 5 and 15), and is either ahead of, or fairly close to, the OECD average distance on many other goals (Figure 3). The main exceptions to this are food, health, water and implementation, where performance is slightly below the OECD average (Goals 2, 3, 6 and 17).

Figure 3. Slovenia’s current distance from reaching the goals and the 5Ps of the 2030 Agenda, compared with the OECD average

Note: This figure shows Slovenia’s distance to travel towards each of the 17 goals of the 2030 Agenda. Bars show Slovenia’s performance, while diamonds show the OECD average. White bars indicate missing data. The y-axis indicates the distance from reaching the target in standardised units. 0 indicates that the level for 2030 has already been attained, and the axis starts at 3 as most OECD countries have already attained this level. Distances to target are aggregated at the goal level (all targets weighted equally). To make the level of achievement within the country more distinct, in this figure, data on Official Development Assistance (ODA) are excluded in Goals 1 to 16. Nonetheless, total ODA, ODA focusing on capacity building and national planning as well as ODA commitments to statistical capacity building are included in Goal 17 “implementation” and under Partnership.

GLOBAL CONTRIBUTION TO THE 2030 AGENDA

Slovenia’s performance on some SDG targets pertaining to global contributions

Indicators can also be grouped to examine OECD countries’ global contribution to the 2030 Agenda. This may help countries consider how they influence – positively or negatively, intentionally or unintentionally – the ability of other countries to achieve their goals.

As a starting point, this study considers Official Development Assistance (ODA), support to national agricultural producers, and demand-based CO₂ productivity. Future work will aim to develop a fuller assessment, considering a wider range of “transboundary” impacts.

Slovenia performs significantly below the OECD average in terms of ODA flows and demand-based CO₂ productivity. Data on producer support (i.e. subsidies to agricultural producers) are not available.
Based on the 129 available indicators allowing coverage of 96 of the 169 SDG targets, Sweden has currently achieved 27 of the 2030 targets. The remaining distances to achieve the targets are small in many areas, but a few challenges remain (Figure 1).

Figure 1. Sweden’s current distance from achieving SDGs’ 2030 targets

Note: The chart shows how far Sweden has already progressed towards each available target. The longer the bars the shorter the distance is to be travelled by 2030. Targets are clustered by goal, and goals are clustered by the “5Ps” of the 2030 Agenda (outer circle).

These results rely on the best comparative indicators currently available in various OECD and UN databases, in line with the UN global indicator framework. However, a number of important data gaps need to be addressed to enable a more complete assessment. For Sweden, health and education are the only goals with full target coverage while sustainable production, oceans and cities have less than 30% of their targets covered (Figure 2).

Figure 2. The statistical agenda ahead: Sweden’s data coverage
Percentage of targets for which there is at least one indicator by goals and the 5Ps of the 2030 Agenda, compared with the OECD total

Note: The global indicator framework developed by the UN Inter-Agency and Expert Group on SDG Indicators and adopted by the UN Statistical Commission in March 2017 agreed upon 232 indicators to measure the 169 targets. Reflecting data availability, this study considers 131 indicators covering 98 targets.
Sweden is on average closest to reaching most goals in the Planet category (Figure 3). It also has very good outcomes in some of the People goals as well as on Prosperity. However, it is further away from reaching other goals, most notably on gender equality.

Relative to the OECD average, Sweden outperforms on most goals, especially within the people and prosperity categories. On the goals of sustainable production, inequality and energy (Goals 12, 10 and 7), Sweden is fairly close to the OECD average (Figure 3).

**Figure 3. Sweden’s current distance from reaching the goals and the 5Ps of the 2030 Agenda, compared with the OECD average**

Note: This figure shows Sweden’s distance to travel towards each of the 17 goals of the 2030 Agenda. Bars show Sweden’s performance, while diamonds show the OECD average. White bars indicate missing data. The y-axis indicates the distance from reaching the target in standardised units. 0 indicates that the level for 2030 has already been attained, and the axis starts at 3 as most OECD countries have already attained this level. Distances to target are aggregated at the goal level (all targets weighted equally). To make the level of achievement within the country more distinct, in this figure, data on Official Development Assistance (ODA) are excluded in Goals 1 to 16. Nonetheless, total ODA, ODA focusing on capacity building and national planning as well as ODA commitments to statistical capacity building are included in Goal 17 “implementation” and under Partnership.

**GLOBAL CONTRIBUTION TO THE 2030 AGENDA**

Sweden’s performance on some SDG targets pertaining to global contributions

Indicators can also be grouped to examine OECD countries’ global contribution to the 2030 Agenda. This may help countries consider how they influence – positively or negatively, intentionally or unintentionally – the ability of other countries to achieve their goals.

As a starting point, this study considers Official Development Assistance (ODA), support to national agricultural producers, and demand-based CO2 productivity. Future work will aim to develop a fuller assessment, considering a wider range of “transboundary” impacts.

Sweden performs significantly above the OECD average in terms of ODA flows and demand-based CO2 productivity. Data on producer support (i.e. subsidies to agricultural producers) are not available.
